

QA Summary Note — DocuSign Clone

Overall impression: The clone covers the main DocuSign-style envelope workflow and is broadly usable, but the latest test pass identified gaps in validation, recipient controls, navigation, filtering, and UI fidelity. The spreadsheet records **45 bugs: 2 P0, 2 P1, 26 P2, 9 P3, and 6 P4**. All recorded issues were reproduced in 5/5 attempts.

Top 5 bugs

BUG-006 — Invalid email accepted and allows progression (P0) — A malformed recipient email is accepted and the flow can continue, making recipient validation unreliable.

BUG-007 — Edit Recipients Save does not save changes (P0) — Changes made while editing recipients are not persisted, directly affecting a core envelope workflow.

BUG-005 — Recipient customization options are disabled (P1) — Recipient customization controls are unavailable in a core recipient setup flow.

BUG-012 — Duplicate recipient email accepted and file is sent (P1) — The same email can be added twice and the envelope can still be sent, indicating a validation gap.

BUG-001 — Footer/help links do nothing (P2) — Several user-facing support/navigation links produce no response, affecting multiple entry points on the Home screen.

Coverage

Tested Home/Dashboard, Get Signatures, recipient setup and editing, Add Fields, Agreements, Templates, filters and Advanced Search, navigation, header controls, footer/help areas, and visual fidelity against the original DocuSign. The latest sheet also includes pixel/UI differences such as spacing, separators, sizing, and control presentation.

Skipped / out of scope

CSV/PDF/image export, third-party integrations, performance/load benchmarking, and security/penetration testing, in line with the assignment scope. Obvious UI responsiveness issues were still recorded when encountered.

Assumptions / notes

Comparisons were made against the original DocuSign screens used during testing. Account/plan state and navigation configuration can explain some differences, so such differences were not treated as defects unless the behavior was clearly inconsistent with the corresponding original flow. The bug tracker is the source of truth for the current severity levels.
